Japan's economic growth in the postwar period has been characterized by a very rapid growth in productivity, achieved, to a great extent, through massive borrowing of technology from more advanced countries.

4.1.1 Total Factor Productivity (TFP) estimation

The production function is assumed to be Cobb-Douglas with constant returns to scale. The total factor productivity (TFP) is estimated using the following steps:

1. The production function is written as:

$$y_t = A_t \left(\sum_{i=1}^n \alpha_i x_{it}^\rho \right)^{\frac{1}{\rho}}$$
2. The logarithm of the production function is taken to linearize it:

$$\ln y_t = \ln A_t + \frac{1}{\rho} \ln \left(\sum_{i=1}^n \alpha_i x_{it}^\rho \right)$$
3. The logarithm of the sum of inputs is approximated using a first-order Taylor expansion around the mean values of the inputs:

$$\ln \left(\sum_{i=1}^n \alpha_i x_{it}^\rho \right) \approx \ln \left(\sum_{i=1}^n \alpha_i \bar{x}_i^\rho \right) + \frac{1}{\rho} \sum_{i=1}^n \frac{\alpha_i \bar{x}_i^{\rho-1}}{\sum_{i=1}^n \alpha_i \bar{x}_i^\rho} (x_{it} - \bar{x}_i)$$
4. The production function is then approximated as:

$$\ln y_t \approx \ln A_t + \sum_{i=1}^n \beta_i \ln x_{it}$$
5. The parameters β_i and $\ln A_t$ are estimated using ordinary least squares (OLS) regression.
6. The total factor productivity (TFP) is calculated as:

$$A_t = \frac{y_t}{\prod_{i=1}^n x_{it}^{\beta_i}}$$

The following table shows the results of the regression analysis. The dependent variable is the natural logarithm of the number of foreign-born workers in the United States. The independent variables are the natural logarithm of the total number of workers, the natural logarithm of the number of foreign-born workers in the United States, and the natural logarithm of the number of foreign-born workers in the United States squared. The results show that the coefficient on the natural logarithm of the total number of workers is positive and significant, while the coefficient on the natural logarithm of the number of foreign-born workers in the United States is negative and significant. The coefficient on the natural logarithm of the number of foreign-born workers in the United States squared is positive and significant. The adjusted R-squared is 0.12.

A Descriptive statistics

Table A.1: Descriptive statistics of manufacturing activities

ISIC rev.3 at 2-digit level	Observations	Description
15	10,764	Manufacture of food products and beverages
17	1,656	Manufacture of textiles
18	1,773	Manufacture of wearing apparel; dressing and dyeing of fur
19	883	Tanning and dressing of leather; manufacture of luggage, handbags, saddlery, harness and footwear
20	2,320	Manufacture of wood and of products of wood and cork, except furniture; manufacture of articles of straw and plaiting materials
21	1,026	Manufacture of paper and paper products
22	1,716	Publishing, printing and reproduction of recorded media
24	2,033	Manufacture of chemicals and chemical products
25	2,144	Manufacture of rubber and plastics products
26	1,816	Manufacture of other non-metallic mineral products
28	2,473	Manufacture of fabricated metal products, except machinery and equipment
29	1,844	Manufacture of machinery and equipment n.e.c.
31	499	Manufacture of electrical machinery and apparatus n.e.c.
33	205	Manufacture of medical, precision and optical instruments, watches and clocks
34	482	Manufacture of motor vehicles, trailers and semi-trailers
35	296	Manufacture of other transport equipment
36	1,608	Manufacture of furniture; manufacturing n.e.c.

⁴¹ For ease of exposition I will only include one variable that represents labor, although in this study I use skilled and unskilled labor as two different inputs.

ρ \rightarrow \rightarrow \rightarrow n \rightarrow y n \rightarrow n \rightarrow n \rightarrow

V \rightarrow -1 \rightarrow -1 \rightarrow $ill+$ 1 \rightarrow -1 \rightarrow
